
Свёрточные нейронные сети: **MNIST** Кошкарев 20223

Нейросети и машинное обучение

Лабораторная работа 3. Применение свёрточных нейронных сетей в задаче классификации изображений

Цель. Изучить технику работы со свёрточными нейронными сетями.

Описание задачи

На основании предложенных примеров изучить свёрточные нейронные сети для классификации изображений по базам MNIST и CIFAR10

Задание

1. Изучить текст примеров нейронных сетей, обратить внимание на структуры данных, функцию потерь, описание архитектуры CNN
2. Исследовать точность классификации в зависимости от
 - числа свёрточных слоев,
 - число каналов
 - типа пулинга
 - функции активации
 - числа полносвязных слоев
3. Сделать выводы

ВНИМАНИЕ: Рассматривается *задача классификации изображений*.

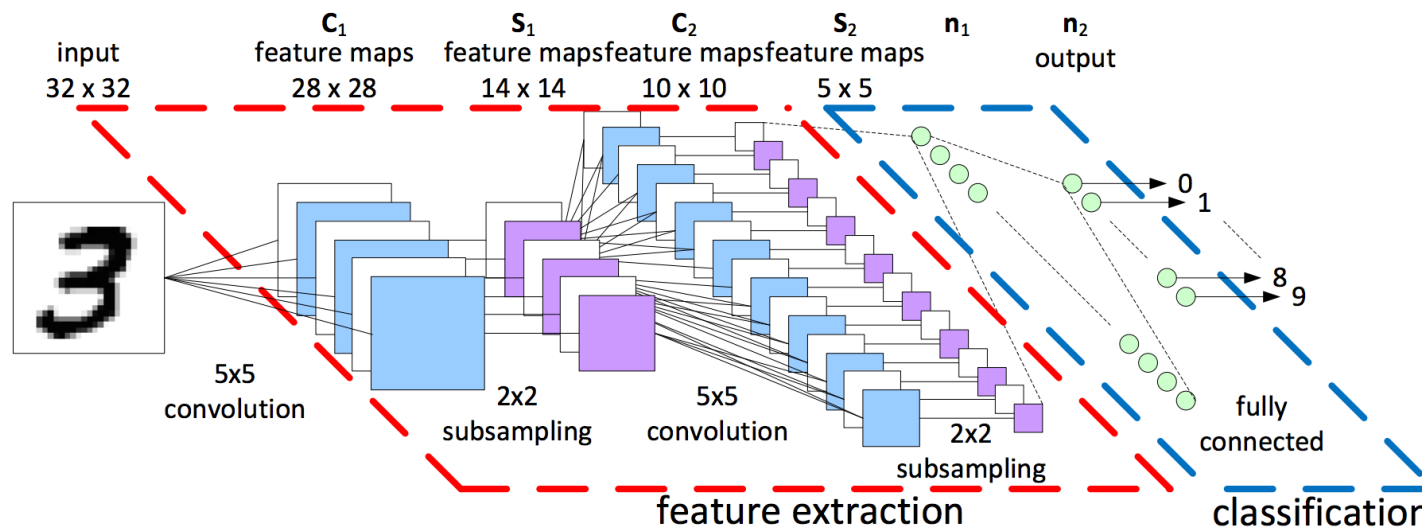

Свёрточная нейросеть (Convolutional Neural Network, CNN) - это многослойная нейросеть, имеющая в своей архитектуре помимо *полносвязных слоёв* (а иногда их может и не быть) ещё и **свёрточные слои (Conv Layers)** и **pooling-слои (Pool Layers)**.

Собственно, название такое эти сети получили потому, что в основе их работы лежит операция **свёртки**.

Сразу же стоит сказать, что свёрточные нейросети **были придуманы прежде всего для задач, связанных с изображениями**, следовательно, на вход они тоже "ожидают" изображение.

- Например, вот так выглядит неглубокая свёрточная нейросеть, имеющая такую архитектуру:

Input -> Conv 5x5 -> Pool 2x2 -> Conv 5x5 -> Pool 2x2 -> FC -> Output

Свёрточные нейросети (простые, есть и намного более продвинутые) почти всегда строятся по следующему правилу:

INPUT -> [[CONV -> RELU]*N -> POOL?]*M -> [FC -> RELU]*L -> FC

то есть:

1). **Входной слой** (batch картинок -- тензор размера (batch_size, H, W, C))

2). M блоков ($M \geq 0$) из свёрток и **pooling**-ов, причём именно в том порядке, как в формуле выше. Все эти M блоков вместе называют **feature extractor** свёрточной нейросети, потому что эта часть сети отвечает непосредственно за формирование новых, более сложных признаков поверх тех, которые подаются (то есть, по аналогии с **MLP**, мы опять же переходим к новому признаковому пространству, однако здесь оно строится сложнее, чем в обычных многослойных сетях, поскольку используется операция свёртки)

3). L штук **FullyConnected**-слоёв (с активациями). Эту часть из L **FC**-слоёв называют **classifier**, поскольку эти слои отвечают непосредственно за предсказание нужного класса (сейчас рассматривается задача классификации изображений).

Сверточная нейросеть на PyTorch

Ещё раз напомним про основные компоненты нейросети:

- непосредственно, сама **архитектура** нейросети (сюда входят типы функций активации у каждого нейрона);
- начальная **инициализация** весов каждого слоя;
- метод **оптимизации** нейросети (сюда ещё входит метод изменения `learning_rate`);
- размер **батчей** (`batch_size`);
- количество **эпох** обучения (`num_epochs`);
- **функция потерь** (`loss`);
- тип **регуляризации** нейросети (для каждого слоя можно свой);

То, что связано с *данными и задачей*:

- само **качество** выборки (непротиворечивость, чистота, корректность постановки задачи);
- **размер** выборки;

Так как мы сейчас рассматриваем **архитектуру CNN**, то, помимо этих компонент, в свёрточной нейросети можно настроить следующие вещи:

- (в каждом **ConvLayer**) **размер фильтров (окна свёртки)** (`kernel_size`)
- (в каждом **ConvLayer**) **количество фильтров** (`out_channels`)
- (в каждом **ConvLayer**) **размер шага окна свёртки (stride)** (`stride`)
- (в каждом **ConvLayer**) **тип padding'a** (`padding`)

- (в каждом **PoolLayer**) **размер окна pooling'a** (`kernel_size`)
- (в каждом **PoolLayer**) **шаг окна pooling'a** (`stride`)
- (в каждом **PoolLayer**) **тип pooling'a** (`pool_type`)
- (в каждом **PoolLayer**) **тип padding'a** (`padding`)

Какими их берут обычно -- будет показано в примере ниже. По крайней мере, можно начинать с этих настроек, чтобы понять, какое качество "из коробки" будет у простой модели.

Посмотрим, как работает **CNN** на **MNIST**'е и на **CIFAR**'е:

MNIST

MNIST: это набор из **70k** картинок рукописных цифр от **0** до **9**, написанных людьми, **60k** из которых являются тренировочной выборкой (`train dataset`)), и ещё **10k** выделены для тестирования модели (`test dataset`).

In [1]:

```
#!/pip install torch torchvision
```

In [2]:

```
import torch
import torchvision
from torchvision import transforms

import numpy as np
import matplotlib.pyplot as plt
%matplotlib inline
```

Скачаем и загрузим данные в `DataLoader` 'ы:

Обратите внимание на аргумент `batch_size` : именно он будет отвечать за размер батча, который будет подаваться при оптимизации нейросети

In [3]:

```
transform = transforms.Compose(
    [transforms.ToTensor()])

trainset = torchvision.datasets.MNIST(root='./data', train=True,
                                       download=True, transform=transform)
trainloader = torch.utils.data.DataLoader(trainset, batch_size=4,
                                           shuffle=True, num_workers=2)

testset = torchvision.datasets.MNIST(root='./data', train=False,
                                       download=True, transform=transform)
testloader = torch.utils.data.DataLoader(testset, batch_size=4,
                                          shuffle=False, num_workers=2)

classes = tuple(str(i) for i in range(10))
```

Сами данные лежат в полях `trainloader.dataset.train_data` и `testloader.dataset.test_data` :

In [4]:

```
trainloader.dataset.train_data.shape
```

```
C:\Users\koshi8bit\anaconda3\lib\site-packages\torchvision\datasets\mnist.py:62: UserWarning: train_data has been renamed data
  warnings.warn("train_data has been renamed data")
```

Out[4]:

```
torch.Size([60000, 28, 28])
```

In [5]:

```
testloader.dataset.test_data.shape
```

```
C:\Users\koshi8bit\anaconda3\lib\site-packages\torchvision\datasets\mnist.py:67: UserWarning: test_data has been renamed data
  warnings.warn("test_data has been renamed data")
```

Out[5]:

```
torch.Size([10000, 28, 28])
```

Выведем первую картинку:

In [6]:

```
trainloader.dataset.train_data[0]
```

Out[6]:

```

In [11]:

```
plt.imshow(numpy_img);
```

In [12]:

```
plt.imshow(numpy_img, cmap='gray');
```

Отрисовка заданной цифры:

In [13]:

```
# случайный индекс от 0 до размера тренировочной выборки
```

```
i = np.random.randint(low=0, high=60000)
```

```
plt.imshow(trainloader.dataset.train_data[i].numpy(), cmap='gray');
```

Как итерироваться по данным с помощью `loader`? Очень просто:

In [14]:

```
i=0
for data in trainloader:
    print(len(data))
    print('Images:', data[0])
    print('Labels:', data[1])
    #i = i+1
    #if i==5:
    break
```

2

```
Images: tensor([[[[0., 0., 0., ..., 0., 0., 0.],
                  [0., 0., 0., ..., 0., 0., 0.],
                  [0., 0., 0., ..., 0., 0., 0.],
                  ...,
                  [0., 0., 0., ..., 0., 0., 0.],
                  [0., 0., 0., ..., 0., 0., 0.],
                  [0., 0., 0., ..., 0., 0., 0.]]]],
```

```
[[[0., 0., 0., ..., 0., 0., 0.],
   [0., 0., 0., ..., 0., 0., 0.],
   [0., 0., 0., ..., 0., 0., 0.],
   ...,
   [0., 0., 0., ..., 0., 0., 0.],
   [0., 0., 0., ..., 0., 0., 0.],
   [0., 0., 0., ..., 0., 0., 0.]]]]
```

```

[0., 0., 0., ..., 0., 0., 0.]],

[[[0., 0., 0., ..., 0., 0., 0.],
  [0., 0., 0., ..., 0., 0., 0.],
  [0., 0., 0., ..., 0., 0., 0.],
  ...,
  [0., 0., 0., ..., 0., 0., 0.],
  [0., 0., 0., ..., 0., 0., 0.],
  [0., 0., 0., ..., 0., 0., 0.] ]],

[[[0., 0., 0., ..., 0., 0., 0.],
  [0., 0., 0., ..., 0., 0., 0.],
  [0., 0., 0., ..., 0., 0., 0.],
  ...,
  [0., 0., 0., ..., 0., 0., 0.],
  [0., 0., 0., ..., 0., 0., 0.],
  [0., 0., 0., ..., 0., 0., 0.] ]]]
)
Labels: tensor([1, 6, 5, 3])

```

То есть мы имеем дело с кусочками данных размера **batch_size** (в данном случае = 4), причём в каждом батче есть как объекты, так и ответы на них (то есть и X , и y).

Теперь вернёмся к тому, что в **PyTorch** есть две "парадигмы" построения нейросетей -- `Functional` и `Seuquential`. Со второй мы уже хорошенько разобрались в предыдущих ноутбуках по нейросетям, теперь мы используем именно `Functional` парадигму, потому что при построении свёрточных сетей это намного удобнее:

In [15]:

```

import torch.nn as nn
import torch.nn.functional as F # Functional

```

In [16]:

```

# # Заметьте: класс наследуется от nn.Module
# class SimpleConvNet(nn.Module):
#     def __init__(self):
#         # вызов конструктора предка
#         super(SimpleConvNet, self).__init__()
#         # необходимо заранее знать, сколько каналов у картинки (сейчас = 1),
#         # которую будем подавать в сеть, больше ничего
#         # про входящие картинки знать не нужно
#         self.conv1 = nn.Conv2d(in_channels=1, out_channels=6, kernel_size=5)
#         self.pool = nn.MaxPool2d(kernel_size=2, stride=2)
#         self.conv2 = nn.Conv2d(in_channels=6, out_channels=16, kernel_size=5)
#         self.fc1 = nn.Linear(4 * 4 * 16, 120) # !!!

```

```
#         self.fc2 = nn.Linear(120, 84)
#         self.fc3 = nn.Linear(84, 10)

#     def forward(self, x):
#         x = self.pool(F.relu(self.conv1(x)))
#         x = self.pool(F.relu(self.conv2(x)))
#         # print(x.shape)
#         x = x.view(-1, 4 * 4 * 16) # !!!
#         x = F.relu(self.fc1(x))
#         x = F.relu(self.fc2(x))
#         x = self.fc3(x)
#         return x
```

Важное примечание: Вы можете заметить, что в строчках с `#!!!` есть не очень понятное сходство число `4 * 4 * 16`. Это -- размерность тензора перед **FC**-слоями (**H x W x C**), тут её приходится высчитывать вручную (в **Keras**, например, `.Flatten()` всё делает за Вас). Однако есть один *лайфхак* -- просто сделайте в `forward()` `print(x.shape)` (закомментированная строка). Вы увидите размер `(batch_size, C, H, W)` -- нужно перемножить все, кроме первого (**batch_size**), это и будет первая размерность `Linear()`, и именно в `C * H * W` нужно "развернуть" **x** перед подачей в `Linear()`.

То есть нужно будет запустить цикл с обучением первый раз с `print()` и сделать после него `break`, посчитать размер, вписать его в нужные места и стереть `print()` и `break`.

Код обучения слоя:

In [17]:

```
from tqdm import tqdm_notebook, tqdm
```

In [18]:

```
# # объявляем сеть
# net = SimpleConvNet()

# # выбираем функцию потерь
# loss_fn = torch.nn.CrossEntropyLoss()

# # выбираем алгоритм оптимизации и learning_rate
# learning_rate = 1e-4
# optimizer = torch.optim.Adam(net.parameters(), lr=learning_rate)

# # итерируемся
# for epoch in tqdm_notebook(range(3)):

#     running_loss = 0.0
#     for i, batch in enumerate(tqdm_notebook(trainloader)):
#         # так получаем текущий батч
#         X_batch, y_batch = batch
```

```
#         # обнуляем веса
#         optimizer.zero_grad()

#         # forward + backward + optimize
#         y_pred = net(X_batch)
#         loss = loss_fn(y_pred, y_batch)
#         loss.backward()
#         optimizer.step()

#         # выведем текущий loss
#         running_loss += loss.item()
#         # выведем качество каждые 2000 батчей
#         if i % 2000 == 1999:
#             print('[%d, %5d] loss: %.3f' %
#                   (epoch + 1, i + 1, running_loss / 2000))
#             running_loss = 0.0

# print('Обучение закончено')
```

Протестируем на всём тестовом датасете, используя метрику **accuracy_score**:

In [19]:

```
# class_correct = list(0. for i in range(10))
# class_total = list(0. for i in range(10))

# with torch.no_grad():
#     for data in testloader:
#         images, labels = data
#         y_pred = net(images)
#         _, predicted = torch.max(y_pred, 1)
#         c = (predicted == labels).squeeze()
#         for i in range(4):
#             label = labels[i]
#             class_correct[label] += c[i].item()
#             class_total[label] += 1

# for i in range(10):
#     print('Accuracy of %5s : %2d %%' % (
#         classes[i], 100 * class_correct[i] / class_total[i]))
```

Два свёрточных слоя победили многослойную нейросеть (из ноутбука с домашним заданием). Это показывает эффективность применения операции свёртки при работе с изображениями.

Протестируем эту нейросеть на отдельных картинках из тестового датасета: напишем функцию, которая принимает индекс картинки в тестовом датасете, отрисовывает её, потом запускает на ней модель (нейросеть) и выводит результат предсказания.

In [20]:

In [20]:

```
# i = np.random.randint(low=0, high=10000)

# def visualize_result(index):
#     image = testloader.dataset.test_data[index].numpy()
#     plt.imshow(image, cmap='gray')

#     y_pred = net(torch.Tensor(image).view(1, 1, 28, 28))
#     print(y_pred)
#     pred, predicted = torch.max(y_pred, 1)
#     print(pred)

#     #batch = testloader.dataset.test_data[index]
#     #print(batch[1])
#     #loss = loss_fn(y_pred, y_batch)

#     plt.title(f'Predicted: {predicted}')

# visualize_result(i)
```

Можете запускать ячейку выше много раз (нажимая **Ctrl+Enter**) и видеть, что предсказывает нейросеть в зависимости от поданной на вход картинки.

ИТОГИ В пятёрке лучших оказались функции **elu** и **tanh**

Нарращивание слоя конволюшена особо ничего не дало.

В изученных ядрах лучше всего себя показали ядра размером **5** в каждом последующем слое. Уменьшение размера до **3** дало среднее падение на **0.2%**

Добавление слоя **fc** в целом показало себя не плохо (попало в **5** лучших)

Average pooling работал хуже, чем **Max**.

Кошкарев Алексей **20223**
